

Leaders in On Board Power

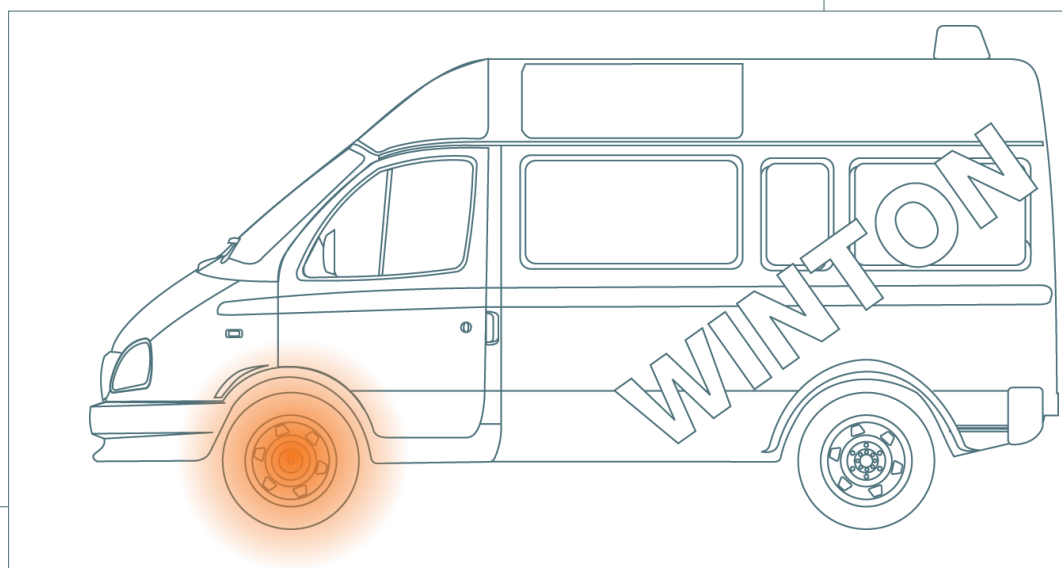

Front-Wheel Drive Systems

Demand for front wheel drive (FWD) on board power installations continues to grow with increasing choice and application of FWD options available from vehicle manufacturers. In response to client demand and significant operational and financial advantages associated with these models, WINTON has developed a range of FWD systems.

Our designs are driven by client feedback and operational requirements; these include power, ergonomic, environmental, noise and reliability.

It is essential to ensure that while continuing to meet the demanding needs of our clients our systems do not adversely affect the integrity of the vehicle and manufacturer warranties. With this in mind we have developed a system that delivers all of the benefits associated with WINTON rear wheel drive products and compliments the vehicle manufacturer design, including:

- Simple push button or manual operation
- Reduced operational and road noise
- Lightweight
- Clear load area
- Ignition over ride security system
- Fuel efficient
- Reduced load to floor height
- No air receiver required
- Reduced HSE risk and compliance requirements
